

## TPC GROUP 14

# Problem Statement and Scope

## Week 1 planning

Client: SkillsTrack Training Centre

Project: Learner Support Portal

Programme: Technical Programming Cycle | September 2026

## Problem Statement and Project Scope

### Problem statement

SkillsTrack Training Centre currently manages learner goals, tasks, support bookings and progress through separate documents and messages. This makes it difficult for learners to keep track of their outstanding work and for assessors to monitor learner activity and progress efficiently.

The project will address this problem by developing a browser-based learner support portal that brings these activities together in one central system. The portal will allow learners to manage their tasks, book support sessions and view their progress, while providing assessors/administrators with appropriate access to learner support information.

### Project Scope

#### In scope

The learner support portal will include the following:

1. User registration, sign in and sign out using firebase authentication.
2. A learner dashboard showing task totals, completed work, outstanding work and calculated progress.
3. A task manager that allows learners to create, view, edit, complete and delete learning tasks.
4. A confirmation step before a task is deleted.
5. A support session booking form where learners can submit support requests and receive status feedback.
6. Search, filtering or sorting of tasks or learning resources.
7. A non sensitive, cookie based user preference, such as theme, display mode or selected filter.
8. A printable learner progress summary.
9. An appropriate redirect within the application flow.
10. A JavaScript driven animation and controlled multimedia element.
11. A basic interactive coding mini game.

12. Firebase realtime database integration for storing and retrieving application data.
13. REST API operations for working with Firebase data.
14. Appropriate access for learners and assessors/administrators based on their roles.
15. A responsive browser based interface using HTML, CSS and JavaScript.

## Out of Scope

The following are outside the agreed project scope:

1. A mobile application for Android or iOS.
2. Payment processing or financial transactions.
3. Storage of passwords in the application database or cookies.
4. Unrestricted public access to learner information.
5. Features unrelated to learner support, task management, progress tracking or the approved mini-game.
6. Advanced administrative functionality that has not been approved as part of the project requirements.

## Scope Constraints

The project must:

- Use HTML5, CSS3 and JavaScript (ES6 or later).
- Use Firebase Realtime Database for application data.
- Use an approved Firebase authentication method.
- Use Git and GitHub for version control and team collaboration.
- Include a basic GitHub Actions continuous integration check.
- Follow appropriate data security and validation practices.
- Be completed within the two-month integrated project period.
